

0.19715 Sept. after sunset⁸ northwest

NOTES: 1. The first two columns are the same as in the previous table. The third column is the number of cases in the sample. The fourth column is the number of cases in the population. The fifth column is the ratio of the number of cases in the sample to the number of cases in the population. The sixth column is the ratio of the number of cases in the sample to the number of cases in the population, weighted by the inverse of the probability of selection. The seventh column is the ratio of the number of cases in the sample to the number of cases in the population, weighted by the inverse of the probability of selection, and adjusted for non-response. The eighth column is the ratio of the number of cases in the sample to the number of cases in the population, weighted by the inverse of the probability of selection, and adjusted for non-response, and further adjusted for differential non-response. The ninth column is the ratio of the number of cases in the sample to the number of cases in the population, weighted by the inverse of the probability of selection, and adjusted for non-response, and further adjusted for differential non-response, and finally adjusted for differential non-response, and finally adjusted for differential non-response.
